Introduction

- YouTube Video: **Convolutional Neural Networks (CNNs) explained** from Deeplizard

https://youtu.be/YRhxdVk_sIs

1. Introduction

- **Convolutional neural networks (CNNs)** emerged from the study of the brain's **visual cortex**.
- Many neurons in the visual cortex have a small **local receptive field**.

Outline

1. Introduction
2. Convolutional layer
 1. Filters
 2. Stacking feature maps
 3. Mathematical summary
 4. Memory requirements
3. Pooling layer
4. CNN architectures
 1. Example – Fashion MNIST
 2. ResNet
5. Using pretrained models
6. Pretrained models for transfer learning
7. Classification and localization
8. Object detection
9. Semantic segmentation
10. Exercises

2. Convolutional Layer

- **Neurons** in one layer are not connected to every single pixel/neuron in the previous layer, but only to pixels/neurons in their **receptive fields**.
- This architecture allows the network to concentrate on **low-level features** in one layer, then assemble them into **higher-level features** in the next layer.
- Each layer is represented in **2D**.

2. Convolutional Layer

- f_h and f_w are the height and width of the receptive field.
- **Zero padding**: In order for a layer to have the same height and width as the previous layer, it is common to add zeros around the inputs.

2. Convolutional Layer

- It is also possible to connect a large input layer to a smaller layer by **spacing out** the receptive fields.
- The distance between two consecutive receptive fields is called the **stride**.
- A neuron located in row i , column j is connected to the neurons in the previous layer located in:
 - Rows: $i \times s_h$ to $i \times s_h + f_h - 1$
 - Cols: $j \times s_w$ to $j \times s_w + f_w - 1$

2. Convolutional Layer

- Keras supports
 - **No padding** (default)
`padding="VALID"`
 - **Zero padding**
`padding="SAME"`
- Example:
 - Input width: 13
 - Filter width: 6
 - Stride: 5

2. Convolutional Layer

Figure 5.5 Valid locations of 3×3 patches in a 5×5 input feature map

2.1 Filters

- A neuron's weights can be represented as a small image the size of the receptive field, called **filters**.
- When all neurons in a layer use the same line filters, we get the **feature maps** on the top.

2.2 Stacking Feature Maps

- In reality, each layer is **3D** composed of **several feature maps** of equal sizes.
- **Within** one feature map, all neurons **share** the same parameters, but **different** feature maps may have **different** parameters.
- Once the CNN has learned to **recognize a pattern in one location**, it can recognize it in any other location.

2.3 Mathematical Summary

Equation 14-1. Computing the output of a neuron in a convolutional layer

$$z_{i,j,k} = b_k + \sum_{u=0}^{f_h-1} \sum_{v=0}^{f_w-1} \sum_{k'=0}^{f_{n'}-1} x_{i',j',k'} \cdot w_{u,v,k',k} \quad \text{with} \quad \begin{cases} i' = i \times s_h + u \\ j' = j \times s_w + v \end{cases}$$

- $z_{i,j,k}$ is the **output** of the neuron located in row i , column j in feature map k
- $f_{n'}$ is the number of **feature maps** in the previous layer

2.4 Memory Requirements

- Convolutional layers require a **huge amount of RAM**.
- **Example**: Convolutional layer with 5×5 filters, 200 feature maps of size 150×100 , with stride 1 and "same" padding. Input is RGB image (three channels).
 - Parameters = $(5 \times 5 \times 3 + 1) \times 200 = 15,200$
 - Size of feature maps (single precision) = $200 \times 150 \times 100 \times 4 = 12$ MB of RAM
 - 1.2 GB of RAM for a mini batch of 100 instances

9. Semantic segmentation
10. Exercises

3. Pooling Layer

- Its goal is to **subsample** (i.e., shrink) the input image in order to reduce the computational load, the memory usage, and the number of parameters.
- It aggregates the inputs using **max** or **mean**.

Outline

1. Introduction
2. Convolutional layer
 1. Filters
 2. Stacking feature maps
 3. Mathematical summary
 4. Memory requirements
3. Pooling layer
4. CNN architectures
 1. Example – Fashion MNIST
 2. ResNet
5. Using pretrained models
6. Pretrained models for transfer learning
7. Classification and localization
8. Object detection
9. Semantic segmentation
10. Exercises

4. CNN Architectures

- **Stack** few **convolutional layers** (each one generally followed by a **ReLU** layer), then a **pooling** layer, then another few convolutional layers, then another pooling layer, and so on. The image gets **smaller and smaller**, but it also gets **deeper and deeper**. At the end, a **dense NN** is added.

4.1 Example – Fashion MNIST

```
model = keras.models.Sequential([  
    keras.layers.Conv2D(64, 7, activation="relu", padding="same",  
        input_shape=[28, 28, 1]),  
    keras.layers.MaxPooling2D(2),  
    keras.layers.Conv2D(128, 3, activation="relu", padding="same"),  
    keras.layers.Conv2D(128, 3, activation="relu", padding="same"),  
    keras.layers.MaxPooling2D(2),  
    keras.layers.Conv2D(256, 3, activation="relu", padding="same"),  
    keras.layers.Conv2D(256, 3, activation="relu", padding="same"),  
    keras.layers.MaxPooling2D(2),  
    keras.layers.Flatten(),  
    keras.layers.Dense(128, activation="relu"),  
    keras.layers.Dropout(0.5),  
    keras.layers.Dense(64, activation="relu"),  
    keras.layers.Dropout(0.5),  
    keras.layers.Dense(10, activation="softmax")  
])
```

Filter size

Feature maps

2x2 window and stride 2

1)

4.1 Example – Fashion MNIST

```
model.compile(loss="sparse_categorical_crossentropy",  
              optimizer="nadam", metrics=["accuracy"])
```

```
history = model.fit(X_train, y_train, epochs=10,  
                   validation_data=(X_valid, y_valid))
```

Train on 55000 samples, validate on 5000 samples

```
Epoch 1/10 55000/55000 [=====] - 51s 923us/sample - loss:  
0.7183 - accuracy: 0.7529 - val_loss: 0.4029 - val_accuracy: 0.8510
```

...

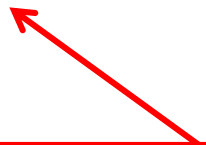

```
Epoch 10/10
```

```
55000/55000 [=====] - 50s 911us/sample - loss: 0.2561 -  
accuracy: 0.9145 - val_loss: 0.2891 - val_accuracy: 0.9036
```

4.1 Example – Fashion MNIST

```
score = model.evaluate(X_test, y_test)
X_new = X_test[:10] # pretend we have new images
y_pred = model.predict(X_new)
```

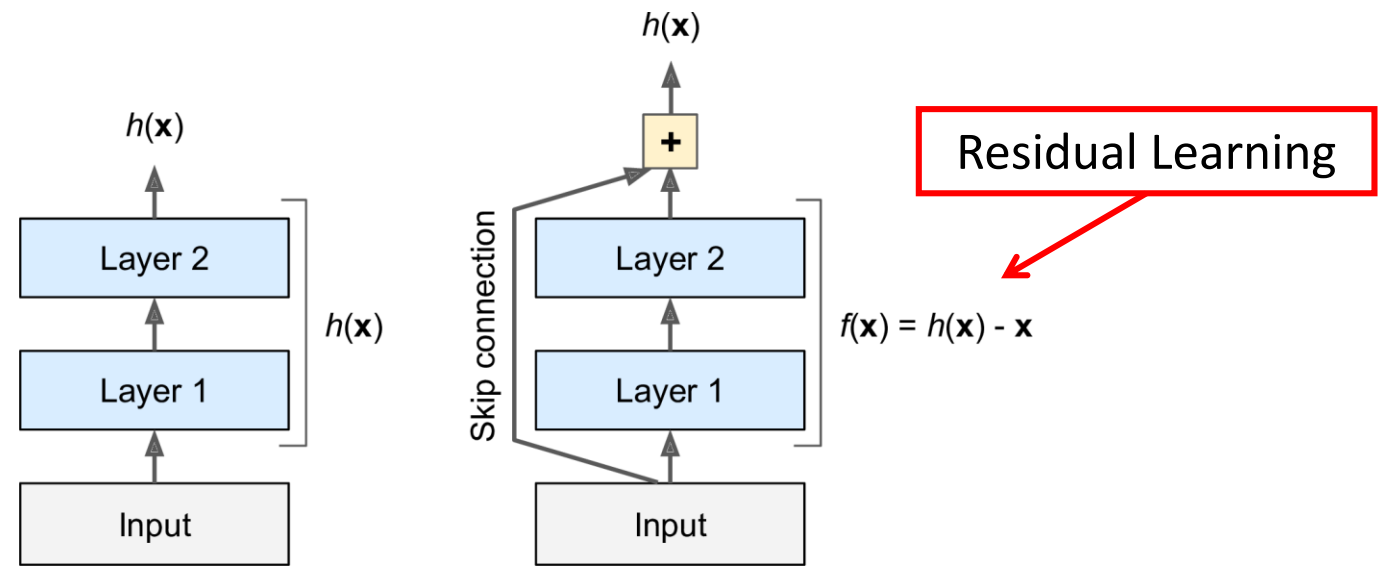

```
10000/10000 [=====] - 2s 239us/sample - loss:
0.2972 - accuracy: 0.8983
```

Can reach 92% with
more epochs

4.2 ResNet

- **Residual Network** (or ResNet) won the ILSVRC 2015 challenge.
- Top-5 error rate under 3.6%, using an extremely deep CNN composed of **152 layers**.
- To train such a deep network, it uses **skip connections**.

4.2 ResNet

- The network can start making progress even if several layers have not started learning yet.

 = Layer blocking backpropagation
 = Layer not learning

4.2 ResNet

- ResNet is a **stack** of residual units.

10. Exercises

5. Using Pretrained Models

- Pretrained networks are readily available from the **keras.applications** package.
- Check <https://github.com/keras-team/keras-applications>
- You can load the **ResNet-50** model, pretrained on **ImageNet**, with the following line of code:

```
model = keras.applications.resnet50.ResNet50(weights="imagenet")
```

5. Using Pretrained Models

```
# Input: 224 × 224-pixel images
```

```
images_resized = tf.image.resize(images, [224, 224])
```

```
# Preprocess images, should be scaled 0-255
```

```
inputs = keras.applications.resnet50.preprocess_input(  
    images_resized * 255)
```

```
Y_proba = model.predict(inputs)
```

```
# Get top predictions out of the 1000-class probs.
```

```
top_K = keras.applications.resnet50.decode_predictions(Y_proba, top=3)
```

5. Using Pretrained Models

```
# Print results
for image_index in range(len(images)):
    print("Image #{}".format(image_index))
    for class_id, name, y_proba in top_K[image_index]:
        print(" {} - {:12s} {:.2f}%".format(class_id, name, y_proba * 100))
    print()
```

6. Pretrained Models for Transfer Learning

- Training a pretrained network (**Xception**) for a dataset from TFDS (<https://www.tensorflow.org/datasets>).
- **tf_flowers**: 3670 images, 5 classes

Load the dataset

```
import tensorflow_datasets as tfds
```

```
dataset, info = tfds.load("tf_flowers",  
                           as_supervised=True, with_info=True)
```

```
dataset_size = info.splits["train"].num_examples # 3670
```

```
n_classes = info.features["label"].num_classes # 5
```

```
class_names = info.features["label"].names
```

6. Pretrained Models for Transfer Learning

```
# Reload the dataset with three splits tf.data.Dataset
test_set_raw, valid_set_raw, train_set_raw = tfds.load(
    "tf_flowers", split=["train[:10%]",
                        "train[10%:25%]", "train[25%:]"],
    as_supervised=True)
```

```
# Define the preprocessing function
```

```
def preprocess(image, label):
    resized_image = tf.image.resize(image, [224, 224])
    final_image = keras.applications.xception.preprocess_input(
        resized_image)
    return final_image, label
```

6. Pretrained Models for Transfer Learning

```
# Apply this preprocessing function to the 3 datasets
# Shuffle the training set
# Add batching and prefetching to all the datasets

batch_size = 32

train_set = train_set_raw.shuffle(3000).repeat()
train_set = train_set.map(preprocess).batch(
    batch_size).prefetch(1)

valid_set = valid_set_raw.map(preprocess).batch(
    batch_size).prefetch(1)

test_set = test_set_raw.map(preprocess).batch(
    batch_size).prefetch(1)
```

6. Pretrained Models for Transfer Learning

```
# Load an Xception model, pretrained on ImageNet
# excluding the global avg pool. and dense o/p layers
base_model = keras.applications.xception.Xception(
    weights="imagenet", include_top=False)

# Add global avg pool. layer based on model output
avg = keras.layers.GlobalAveragePooling2D()(base_model.output)
output = keras.layers.Dense(n_classes, # Add dense o/p
    activation="softmax")(avg)
model = keras.models.Model(inputs=base_model.input,
    outputs=output) # Create the Keras Model
```

6. Pretrained Models for Transfer Learning

```
# Freeze the weights of the pretrained layers
```

```
for layer in base_model.layers:
```

```
    layer.trainable = False
```

```
# Compile the model and start training
```

```
optimizer = keras.optimizers.SGD(lr=0.2, momentum=0.9,  
    decay=0.01) # LR=0.2 with scheudle, k=1/0.01
```

```
model.compile(loss="sparse_categorical_crossentropy",  
    optimizer=optimizer, metrics=["accuracy"])
```

```
history = model.fit(train_set, epochs=5,  
    validation_data=valid_set) # Tops at 75-80% acc.
```

$$\eta(t) = \eta_0 / (1 + t/k)$$

6. Pretrained Models for Transfer Learning

```
# Unfreeze the weights of the pretrained layers
for layer in base_model.layers:
    layer.trainable = True

# Recompile with lower LR and decay
optimizer = keras.optimizers.SGD(lr=0.01, momentum=0.9,
    nesterov=True, decay=0.001)
model.compile(loss="sparse_categorical_crossentropy",
    optimizer=optimizer, metrics=["accuracy"])
history = model.fit(train_set, epochs=40,
    validation_data=valid_set) # Result: 95% acc.
```

- 9. Semantic segmentation**
- 10. Exercises**

7. Classification and Localization

- **Localizing** an object in a picture can be expressed as a **regression** task.
- Predict the horizontal and vertical coordinates of the object's center and its height and width.

Common metric:
the Intersection
over Union (IoU)

7. Classification and Localization

```
base_model = keras.applications.xception.Xception(
    weights="imagenet", include_top=False)
avg = keras.layers.GlobalAveragePooling2D()(base_model.output)
class_output = keras.layers.Dense(n_classes, activation="softmax")(avg)
loc_output = keras.layers.Dense(4)(avg)
model = keras.Model(inputs=base_model.input,
    outputs=class_output, loc_output)

model.compile(loss=["sparse_categorical_crossentropy", "mse"],
    loss_weights=[0.8, 0.2],
    optimizer=optimizer, metrics=["accuracy"])
```

7. Classification and localization
- 8. Object detection**
- 9. Semantic segmentation**
10. Exercises

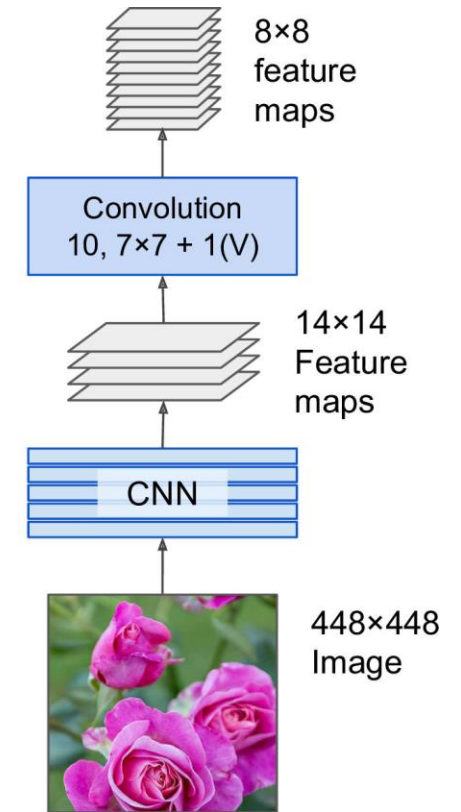

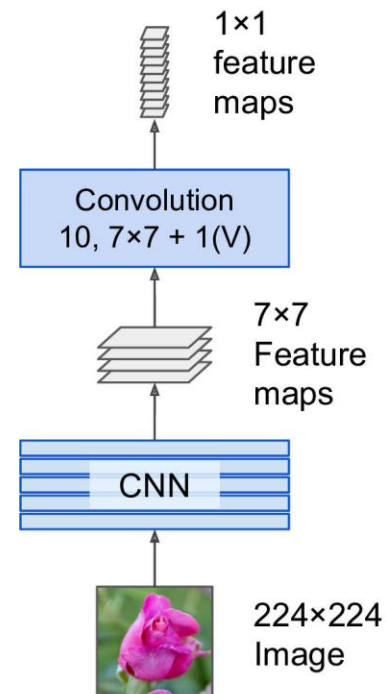

8. Object detection

- The task of **classifying and localizing** multiple objects in an image.
- A **slow** approach is use a CNN trained to classify and locate a single object, then **slide** it across the image.

8.1 Fully Convolutional Networks

- FCN has also a **convolution layer at the output** with **valid padding**.
- FCN can process images of **any size**.
- **Example:**
 - Train the CNN for classification and localization on small images, 10 outputs.
 - For larger image, it output 8×8 grid where each cell contains 10 numbers.

8.2 You Only Look Once (YOLO)

- **YOLO** is an extremely fast and accurate object detection architecture.
 1. Resizes the input image to 448×448
 2. Runs a single convolutional network on the image
 3. Thresholds the resulting detections by the model's confidence.

8.2 You Only Look Once (YOLO)

- Models detection as a regression problem. It divides the image into an $S \times S$ grid.
- For each grid cell predicts B bounding boxes, confidence for those boxes, and C class probabilities.

9. Semantic segmentation
10. Exercises

9. Semantic Segmentation

- Each pixel is classified according to the class of the object it belongs to.
- Can use **FCN** followed by up **sampling** layers.

Exercises

- 14.9. Build your own CNN from scratch and try to achieve the highest possible accuracy on **MNIST**.
- 14.10. Use **transfer learning** for large image classification, going through these steps:
- Create a training set containing at least 100 images per class. For example, you could classify your own pictures based on the location (beach, mountain, city, etc.), or alternatively you can use an existing dataset (e.g., from TensorFlow Datasets).
 - Split it into a training set, a validation set, and a test set.
 - Build the input pipeline, including the appropriate preprocessing operations, and optionally add data augmentation.
 - Fine-tune a pretrained model on this dataset.
